<u>Changes:</u>

In the original design we intended to have the icon representing the current weather being reflected onto a body of water. As there were no icons that properly matched our expectations and required types, we went with a simplistic design that would not upset out colour scheme.

We had designed the alarm to be accessible through Settings, but changed it so that it can only be accessed through the Alarm Icon. This makes the design simpler and more intuitive to use.

We have changed the editing of the alarm time to a drop-down box instead of up/down arrows, as this makes it easier on a phone (minutes can be scrolled through, which is quicker).

We have not included the wind speed on the main screen, but rather just below on the hourly forecast, as the average wind speed is more representative for the users than an instantaneous one.
